

Our environmental policy for protection of climate, environment & people

We are a company that develops tribological solutions, manufactures bearings and sells them worldwide. Our products facilitate movement, support loads, reduce friction and thus help to save energy. These functions also help to preserve a healthy environment, which we want to protect for future generations also through our undertakings.

We want to live up to this responsibility and are committed to uniform environmental protection standards both in our immediate environment and at our production sites.

Our guiding principles are as follows:

Environmental awareness

Regular awareness-raising and practical examples in everyday life encourage awareness and personal responsibility as well as the personal involvement of our employees on their own initiative. Waste avoidance before waste separation forms the principle of all actions. When selecting materials in the company environment, we pay attention to resource-saving production and use. We try to make our vehicle procurement and business trips as environmentally friendly as possible. The legal regulations and official requirements represent the minimum requirements for us.

Products and processes

Our products and proposed technical solutions are examined for their direct and indirect environmental impact at the design stage and designed accordingly. A long operating life of bearings guarantees the most sparing use of resources. We pay attention to strict avoidance of conflict materials when selecting and specifying materials and raw materials. Our processes are constantly improved to increase efficiency and save energy. We also take this into account when making investments such as the purchase of vehicles, equipment, machines and tools.

Suppliers and service providers

What our customers expect from us and what we ensure and exemplify internally in our own claim, we also expect from our suppliers and service providers. We commit our partners to this within the framework of our compliance requirements. Packaging types and materials that we specify to our suppliers are defined in terms of reusability and recyclability.

Involvement of the public

We want to live transparency and convince the public that environmental protection concerns everyone and only works if everyone participates. We as the BTC Group live this out through our digital presence on the Internet, regionally on site and at our production locations. We move in an environmentally conscious manner by bicycle or e-bike on the way to work and in our leisure time and are proud of this because our products installed are there, they drive us twice.

Our company and each individual employee take their social responsibility seriously and we work actively to minimise environmental pollution and resource use. Our company's management system used for this purpose is certified according to ISO 14001 and proves this effectively and sustainably in annual audits.

Our mission is: The environment is our most valuable asset, which must be protected! / 09.04.2021
